## Outline

- Fast Fourier Transform
- Butterfly Structure
- Implementation Issues

## **DFT Algorithm**

The Fourier transform of an analogue signal x(t) is given by:

$$X(\omega) = \int_{-\infty}^{+\infty} x(t) e^{-j\omega t} dt$$

The Discrete Fourier Transform (DFT) of a discrete-time signal x(nT) is given by:

$$X(k) = \sum_{n=0}^{N-1} x[n] e^{-j\frac{2\pi}{N}nk}$$

Where:

$$k = 0, 1, \dots N - 1$$
$$x(nT) = x[n]$$

## **DFT Algorithm**

## **DFT Algorithm**

$$X(k) = \sum_{n=0}^{N-1} x[n] W_N^{nk}$$

x[n] = input
X[k] = frequency bins
W = twiddle factors

$$\begin{split} X(0) &= x[0] W_N^{-0} + x[1] W_N^{-0^{*1}} + \ldots + x[N-1] W_N^{-0^{*(N-1)}} \\ X(1) &= x[0] W_N^{-0} + x[1] W_N^{-1^{*1}} + \ldots + x[N-1] W_N^{-1^{*(N-1)}} \\ &\vdots \\ X(k) &= x[0] W_N^{-0} + x[1] W_N^{-k^{*1}} + \ldots + x[N-1] W_N^{-k^{*(N-1)}} \\ &\vdots \\ X(N-1) &= x[0] W_N^{-0} + x[1] W_N^{-(N-1)^{*1}} + \ldots + x[N-1] W_N^{-(N-1)(N-1)} \end{split}$$

# Note: For N samples of x we have N frequencies representing the signal.

## **Performance of the DFT Algorithm**

- The DFT requires N<sup>2</sup> (NxN) complex multiplications:
  - Each X(k) requires N complex multiplications.
  - Therefore to evaluate all the values of the DFT ( X(0) to X(N-1) ) N<sup>2</sup> multiplications are required.
- The DFT also requires (N-1)\*N complex additions:
  - Each X(k) requires N-1 additions.
  - Therefore to evaluate all the values of the DFT (N-1)\*N additions are required.

#### **Performance of the DFT Algorithm**

# Can the number of computations required be reduced?

- A large amount of work has been devoted to reducing the computation time of a DFT.
- This has led to efficient algorithms which are known as the Fast Fourier Transform (FFT) algorithms.

#### $DFT \rightarrow FFT$

$$X(k) = \sum_{n=0}^{N-1} x[n] W_N^{nk}; \quad 0 \le k \le N-1$$
 [1]

#### x[n] = x[0], x[1], ..., x[N-1]

Lets divide the sequence x[n] into even and odd sequences:

• 
$$x[2n] = x[0], x[2], ..., x[N-2]$$

• 
$$x[2n+1] = x[1], x[3], ..., x[N-1]$$

#### • Equation 1 can be rewritten as:

$$X(k) = \sum_{n=0}^{\frac{N}{2}-1} x[2n] W_N^{2nk} + \sum_{n=0}^{\frac{N}{2}-1} x[2n+1] W_N^{(2n+1)k}$$
[2]

$$\begin{aligned} W_N^{2nk} &= e^{-j\frac{2\pi}{N}nk} = e^{-j\frac{2\pi}{N/2}nk} \\ &= W_{\frac{N}{2}}^{nk} \\ \end{aligned}$$

Then:  

$$X(k) = \sum_{n=0}^{\frac{N}{2}-1} x[2n] W_{\frac{N}{2}}^{nk} + W_{N}^{k} \sum_{n=0}^{\frac{N}{2}-1} x[2n+1] W_{\frac{N}{2}}^{nk}$$

$$= Y(k) + W_{N}^{k} Z(k)$$

The result is that an N-point DFT can be divided into two N/2 point DFT's:

$$X(k) = \sum_{n=0}^{N-1} x[n] W_N^{nk}; \quad 0 \le k \le N-1$$

**N-point DFT** 

Where Y(k) and Z(k) are the two N/2 point DFTs operating on even and odd samples respectively:

$$X(k) = \sum_{n=0}^{\frac{N}{2}-1} x_1[n] W_{\frac{N}{2}}^{nk} + W_N^k \sum_{n=0}^{\frac{N}{2}-1} x_2[n] W_{\frac{N}{2}}^{nk}$$
  
=  $Y(k) + W_N^k Z(k)$  **Two N/2-**  
**point DFTs**

• Periodicity and symmetry of W can be exploited to simplify the DFT further:

$$X(k) = \sum_{n=0}^{\frac{N}{2}-1} x_1[n] W_{\frac{N}{2}}^{nk} + W_N^k \sum_{n=0}^{\frac{N}{2}-1} x_2[n] W_{\frac{N}{2}}^{nk}$$

$$\vdots$$

$$X\left(k + \frac{N}{2}\right) = \sum_{n=0}^{\frac{N}{2}-1} x_1[n] W_{\frac{N}{2}}^{n\left(k+\frac{N}{2}\right)} + W_N^{k+\frac{N}{2}} \sum_{n=0}^{\frac{N}{2}-1} x_2[n] W_{\frac{N}{2}}^{n\left(k+\frac{N}{2}\right)}$$

$$W_N^{k+\frac{N}{2}} = e^{-j\frac{2\pi}{N}k} e^{-j\frac{2\pi}{N}N} = e^{-j\frac{2\pi}{N}k} e^{-j\pi} = -e^{-j\frac{2\pi}{N}k} = -W_N^k$$

$$W_N^{k+\frac{N}{2}} = e^{-j\frac{2\pi}{N/2}k} e^{-j\frac{2\pi}{N/2}N} = e^{-j\frac{2\pi}{N/2}N} = e^{-j\frac{2\pi}{N/2}k} = W_{\frac{N}{2}}^k$$

$$: Periodicity$$

#### Symmetry and periodicity:

$$W_N^{k+N/2} = W_N^k$$
  
 $W_{N/2}^{k+N/2} = W_{N/2}^k$   
 $W_8^{k+4} = W_8^k$   
 $W_8^{k+8} = W_8^k$ 

• Finally by exploiting the symmetry and periodicity, Equation 3 can be written as:

$$X\left(k + \frac{N}{2}\right) = \sum_{n=0}^{\frac{N}{2}-1} x_1[n] W_{\frac{N}{2}}^{nk} - W_N^k \sum_{n=0}^{\frac{N}{2}-1} x_2[n] W_{\frac{N}{2}}^{nk}$$
  
=  $Y(k) - W_N^k Z(k)$ 

[4]

$$X(k) = Y(k) + W_N^k Z(k); \quad k = 0, \dots \left(\frac{N}{2} - 1\right)$$
$$X\left(k + \frac{N}{2}\right) = Y(k) - W_N^k Z(k); \quad k = 0, \dots \left(\frac{N}{2} - 1\right)$$

- Y(k) and W<sup>k</sup><sub>N</sub> Z(k) only need to be calculated once and used for both equations.
- ♦ Note: the calculation is reduced from 0 to N-1 to 0 to (N/2 - 1).

$$X(k) = Y(k) + W_N^k Z(k); \quad k = 0, \dots \left(\frac{N}{2} - 1\right)$$
$$X\left(k + \frac{N}{2}\right) = Y(k) - W_N^k Z(k); \quad k = 0, \dots \left(\frac{N}{2} - 1\right)$$

Y(k) and Z(k) can also be divided into N/4 point DFTs using the same process shown above:

$$Y(k) = U(k) + W_{\frac{N}{2}}^{k}V(k) \qquad Z(k) = P(k) + W_{\frac{N}{2}}^{k}Q(k)$$
$$Y\left(k + \frac{N}{4}\right) = U(k) - W_{\frac{N}{2}}^{k}V(k) \qquad Z\left(k + \frac{N}{4}\right) = P(k) - W_{\frac{N}{2}}^{k}Q(k)$$

• The process continues until we reach 2 point DFTs.

# ♦ Illustration of the first decimation in time FFT.

- To efficiently implement the FFT algorithm a few observations are made:
  - Each stage has the same number of butterflies (number of butterflies = N/2, N is number of points).
  - The number of DFT groups per stage is equal to  $(N/2^{stage})$ .
  - The difference between the upper and lower leg is equal to 2<sup>stage-1</sup>.
  - The number of butterflies in the group is equal to 2<sup>stage-1</sup>.

**Example: 8 point FFT** 

- Decimation in time FFT:
  - Number of stages =  $\log_2 N$
  - Number of blocks/stage = N/2<sup>stage</sup>
  - Number of butterflies/block = 2<sup>stage-1</sup>

Chapter 19, Slide 19

Example: 8 point FFT(1) Number of stages:

- Decimation in time FFT:
  - Number of stages =  $\log_2 N$
  - Number of blocks/stage = N/2<sup>stage</sup>
  - Number of butterflies/block = 2<sup>stage-1</sup>

Chapter 19, Slide 20

Stage 1

Example: 8 point FFT(1) Number of stages:

• 
$$N_{stages} = 1$$

Decimation in time FFT:

- Number of stages = log<sub>2</sub>N
- Number of blocks/stage = N/2<sup>stage</sup>
- Number of butterflies/block = 2<sup>stage-1</sup>

Chapter 19, Slide 21

Example: 8 point FFT

(1) Number of stages:

• 
$$N_{stages} = 2$$

Decimation in time FFT:

- Number of stages = log<sub>2</sub>N
- Number of blocks/stage = N/2<sup>stage</sup>
- Number of butterflies/block = 2<sup>stage-1</sup>

Chapter 19, Slide 22

**Example: 8 point FFT** 

(1) Number of stages:

• 
$$N_{stages} = 3$$

Decimation in time FFT:

- Number of stages = log<sub>2</sub>N
- Number of blocks/stage = N/2<sup>stage</sup>
- Number of butterflies/block = 2<sup>stage-1</sup>

Chapter 19, Slide 23

**Example: 8 point FFT** 

(1) Number of stages:

• 
$$N_{stages} = 3$$

- (2) Blocks/stage:
  - Stage 1:

Decimation in time FFT:

- Number of stages =  $\log_2 N$
- Number of blocks/stage = N/2<sup>stage</sup>
- Number of butterflies/block = 2<sup>stage-1</sup>

Chapter 19, Slide 24

**Example: 8 point FFT** 

(1) Number of stages:

• 
$$N_{stages} = 3$$

- (2) Blocks/stage:
  - Stage 1:  $N_{blocks} = 1$

• Decimation in time FFT:

- Number of stages = log<sub>2</sub>N
- Number of blocks/stage = N/2<sup>stage</sup>
- Number of butterflies/block = 2<sup>stage-1</sup>

Chapter 19, Slide 25

**Example: 8 point FFT** 

(1) Number of stages:

• 
$$N_{stages} = 3$$

- (2) Blocks/stage:
  - Stage 1: N<sub>blocks</sub> = 2

• Decimation in time FFT:

- Number of stages = log<sub>2</sub>N
- Number of blocks/stage = N/2<sup>stage</sup>
- Number of butterflies/block = 2<sup>stage-1</sup>

Chapter 19, Slide 26

**Example: 8 point FFT** 

(1) Number of stages:

• 
$$N_{stages} = 3$$

- (2) Blocks/stage:
  - Stage 1:  $N_{blocks} = 3$

Decimation in time FFT:

- Number of stages = log<sub>2</sub>N
- Number of blocks/stage = N/2<sup>stage</sup>
- Number of butterflies/block = 2<sup>stage-1</sup>

Chapter 19, Slide 27

**Example: 8 point FFT** 

(1) Number of stages:

• 
$$N_{stages} = 3$$

- (2) Blocks/stage:
  - Stage 1: N<sub>blocks</sub> = 4

Decimation in time FFT:

- Number of stages = log<sub>2</sub>N
- Number of blocks/stage = N/2<sup>stage</sup>
- Number of butterflies/block = 2<sup>stage-1</sup>

Chapter 19, Slide 28

**Example: 8 point FFT** 

- (1) Number of stages:
  - $N_{stages} = 3$
- (2) Blocks/stage:
  - Stage 1: N<sub>blocks</sub> = 4
  - Stage 2: N<sub>blocks</sub> = 1

Decimation in time FFT:

- Number of stages = log<sub>2</sub>N
- Number of blocks/stage = N/2<sup>stage</sup>
- Number of butterflies/block = 2<sup>stage-1</sup>

Chapter 19, Slide 29

**Example: 8 point FFT** 

(1) Number of stages:

• 
$$N_{stages} = 3$$

- (2) Blocks/stage:
  - Stage 1: N<sub>blocks</sub> = 4
  - Stage 2: N<sub>blocks</sub> = 2

Decimation in time FFT:

- Number of stages = log<sub>2</sub>N
- Number of blocks/stage = N/2<sup>stage</sup>
- Number of butterflies/block = 2<sup>stage-1</sup>

Chapter 19, Slide 30

**Example: 8 point FFT** 

- (1) Number of stages:
  - $N_{stages} = 3$
- (2) Blocks/stage:
  - Stage 1: N<sub>blocks</sub> = 4
  - Stage 2: N<sub>blocks</sub> = 2
  - Stage 3:  $N_{blocks} = 1$

Decimation in time FFT:

- Number of stages = log<sub>2</sub>N
- Number of blocks/stage = N/2<sup>stage</sup>
- Number of butterflies/block = 2<sup>stage-1</sup>

Chapter 19, Slide 31

- **Example: 8 point FFT**
- (1) Number of stages:
  - $N_{stages} = 3$
- (2) Blocks/stage:
  - Stage 1: N<sub>blocks</sub> = 4
  - Stage 2: N<sub>blocks</sub> = 2
  - Stage 3:  $N_{blocks} = 1$
- (3) **B'flies/block:** 
  - Stage 1:

Decimation in time FFT:

- Number of stages = log<sub>2</sub>N
- Number of blocks/stage = N/2<sup>stage</sup>
- Number of butterflies/block = 2<sup>stage-1</sup>

Chapter 19, Slide 32

- **Example: 8 point FFT**
- (1) Number of stages:
  - $N_{stages} = 3$
- (2) Blocks/stage:
  - Stage 1: N<sub>blocks</sub> = 4
  - Stage 2: N<sub>blocks</sub> = 2
  - Stage 3:  $N_{blocks} = 1$
- (3) **B'flies/block:** 
  - Stage 1: N<sub>btf</sub> = 1

Decimation in time FFT:

- Number of stages = log<sub>2</sub>N
- Number of blocks/stage = N/2<sup>stage</sup>
- Number of butterflies/block = 2<sup>stage-1</sup>

Chapter 19, Slide 33

**Example: 8 point FFT** 

- (1) Number of stages:
  - $N_{stages} = 3$
- (2) Blocks/stage:
  - Stage 1: N<sub>blocks</sub> = 4
  - Stage 2: N<sub>blocks</sub> = 2
  - Stage 3:  $N_{blocks} = 1$
- (3) **B'flies/block:** 
  - Stage 1:  $N_{btf} = 1$
  - Stage 2: N<sub>btf</sub> = 1

- **Decimation in time FFT:** 
  - Number of stages = log<sub>2</sub>N
  - Number of blocks/stage = N/2<sup>stage</sup>
  - Number of butterflies/block = 2<sup>stage-1</sup>

Chapter 19, Slide 34

**Example: 8 point FFT** 

- (1) Number of stages:
  - $N_{stages} = 3$
- (2) Blocks/stage:
  - Stage 1: N<sub>blocks</sub> = 4
  - Stage 2: N<sub>blocks</sub> = 2
  - Stage 3:  $N_{blocks} = 1$
- (3) **B'flies/block:** 
  - Stage 1:  $N_{btf} = 1$
  - Stage 2: N<sub>btf</sub> = 2

• Number of stages =  $\log_2 N$ 

**Decimation in time FFT:** 

- Number of blocks/stage = N/2<sup>stage</sup>
- Number of butterflies/block = 2<sup>stage-1</sup>

Chapter 19, Slide 35

**Example: 8 point FFT** 

- (1) Number of stages:
  - $N_{stages} = 3$
- (2) Blocks/stage:
  - Stage 1: N<sub>blocks</sub> = 4
  - Stage 2: N<sub>blocks</sub> = 2
  - Stage 3:  $N_{blocks} = 1$
- (3) **B'flies/block:** 
  - Stage 1:  $N_{btf} = 1$
  - Stage 2: N<sub>btf</sub> = 2
  - Stage 3: N<sub>btf</sub> = 1
- Number of blocks/stage = N/2<sup>stage</sup>
- Number of butterflies/block = 2<sup>stage-1</sup>

Chapter 19, Slide 36

- Decimation in time FFT:
  - Number of stages =  $\log_2 N$

**Decimation in time FFT:** 

• Number of stages =  $\log_2 N$ 

**FFT Implementation** 

**Example: 8 point FFT** 

- (1) Number of stages:
  - $N_{stages} = 3$
- (2) Blocks/stage:
  - Stage 1: N<sub>blocks</sub> = 4
  - Stage 2: N<sub>blocks</sub> = 2
  - Stage 3:  $N_{blocks} = 1$
- (3) **B'flies/block:** 
  - Stage 1:  $N_{btf} = 1$
  - Stage 2: N<sub>btf</sub> = 2
  - Stage 3: N<sub>btf</sub> = 2
- Number of blocks/stage = N/2<sup>stage</sup>
- Number of butterflies/block = 2<sup>stage-1</sup>

**Decimation in time FFT:** 

• Number of stages =  $\log_2 N$ 

**FFT Implementation** 

**Example: 8 point FFT** 

- (1) Number of stages:
  - $N_{stages} = 3$
- (2) Blocks/stage:
  - Stage 1: N<sub>blocks</sub> = 4
  - Stage 2: N<sub>blocks</sub> = 2
  - Stage 3:  $N_{blocks} = 1$
- (3) **B'flies/block:** 
  - Stage 1:  $N_{btf} = 1$
  - Stage 2: N<sub>btf</sub> = 2
  - Stage 3: N<sub>btf</sub> = 3
- Number of blocks/stage = N/2<sup>stage</sup>
- Number of butterflies/block = 2<sup>stage-1</sup>

**Decimation in time FFT:** 

• Number of stages =  $\log_2 N$ 

**FFT Implementation** 

**Example: 8 point FFT** 

- (1) Number of stages:
  - $N_{stages} = 3$
- (2) Blocks/stage:
  - Stage 1: N<sub>blocks</sub> = 4
  - Stage 2: N<sub>blocks</sub> = 2
  - Stage 3:  $N_{blocks} = 1$
- (3) **B'flies/block:** 
  - Stage 1:  $N_{btf} = 1$
  - Stage 2: N<sub>btf</sub> = 2
  - Stage 3: N<sub>btf</sub> = 4
- Number of blocks/stage = N/2<sup>stage</sup>
- Number of butterflies/block = 2<sup>stage-1</sup>

## FFT Decimation in Frequency

- Similar divide and conquer strategy
  - Decimate in frequency domain
- $X(2k) = \sum_{n=0}^{N-1} x(n) W_N^{2nk}$
- $X(2k) = \sum_{n=0}^{N/2-1} x(n) W_{N/2}^{nk} + \sum_{n=N/2}^{N-1} x(n) W_{N/2}^{nk}$ 
  - Divide into first half and second half of sequence
- X(2k) =

$$\sum_{n=0}^{N/2-1} x(n) W_{N/2}^{nk} + \sum_{n=0}^{N/2-1} x\left(n + \frac{N}{2}\right) W_{N/2}^{\left(n + \frac{N}{2}\right)k}$$

• Simplifying with twidle properties

$$X(2k) = \sum_{n=0}^{N/2-1} \left[ x(n) + x\left(n + \frac{N}{2}\right) \right] W_{N/2}^{nk}$$
  
$$X(2k+1) = \sum_{n=0}^{N/2-1} W_N^n \left[ x(n) - x\left(n + \frac{N}{2}\right) \right] W_{N/2}^{nk}$$

#### FFT Decimation in Frequency Structure

• Stage structure

Figure 5.8 Decomposition of an N-point DFT into two N/2-point DFTs

• Full structure

• Bit reversal happens at output instead of input

## Inverse FFT

• 
$$x(n) = \frac{1}{N} \sum_{k=0}^{N-1} X(k) W_N^{-kn}$$

- Notice this is the DFT with a scale factor and change in twidle sign
- Can compute using the FFT with minor modifications

$$x^*(n) = \frac{1}{N} \sum_{k=0}^{N-1} X^*(k) W_N^{kn}$$

- Conjugate coefficients, compute FFT with scale factor, conjugate result
- For real signals, no final conjugate needed
- Can complex conjugate twidle factors and use in butterfly structure

## FFT Example

- Example 5.10
- Sine wave with f = 50 Hz
  - $x(n) = \sin\left(\frac{2\pi fn}{f_s}\right)$ • n = 0, 1, ..., 128

• 
$$f_s = 256 \, \text{Hz}$$

- Frequency resolution of DFT? •  $\Delta = f_s/N = \frac{256}{128} = 2$  Hz
- Location of peak

$$\bullet 50 = k\Delta \to k = \frac{50}{2} = 25$$

## Spectral Leakage and Resolution

- Notice that a DFT is like windowing a signal to finite length
  - Longer window lengths (more samples) the closer DFT X(k) approximates DTFT X(ω)
- Convolution relationship
  - $x_N(n) = w(n)x(n)$
  - $X_N(k) = W(k) * X(k)$
- Corruption of spectrum due to window properties (mainlobe/sidelobe)
  - Sidelobes result in spurious peaks in computed spectrum known as spectral leakage
    - Obviously, want to use smoother windows to minimize these effects
  - Spectral smearing is the loss in sharpness due to convolution which depends on mainlobe width

- Example 5.15
  - Two close sinusoids smeared together

- To avoid smearing:
  - Frequency separation should be greater than freq resolution
  - $N > \frac{2\pi}{\Delta \omega}$ ,  $N > f_S / \Delta f$

48

# **Power Spectral Density**

- Parseval's theorem
- *E* =
  - $\sum_{n=0}^{N-1} |x(n)|^2 = \frac{1}{N} \sum_{k=0}^{N-1} |X(k)|^2$
  - $|X(k)|^2$  power spectrum or periodogram
- Power spectral density (PSD, or power density spectrum or power spectrum) is used to measure average power over frequencies
- Computed for time-varying signal by using a sliding window technique
  - Short-time Fourier transform
  - Grab *N* samples and compute FFT
    - Must have overlap and use windows

- Spectrogram
  - Each short FFT is arranged as a column in a matrix to give the time-varying properties of the signal
  - Viewed as an image

"She had your dark suit in greasy wash water all year"

# Fast FFT Convolution

- Linear convolution is multiplication in frequency domain
  - Must take FFT of signal and filter, multiply, and iFFT
  - Operations in frequency domain can be much faster for large filters
  - Requires zero-padding because of circular convolution
- Typically, will do block processing
  - Segment a signal and process each segment individually before recombining

# Ex: FFT Effect of N

• Take FFT of cosine using different N values

```
n = [0:29];
x = cos(2*pi*n/10);
N1 = 64;
N2 = 128;
N3 = 256;
X1 = abs(fft(x,N1));
X2 = abs(fft(x, N2));
X3 = abs(fft(x,N3));
F1 = [0 : N1 - 1]/N1;
F2 = [0 : N2 - 1]/N2;
F3 = [0 : N3 - 1]/N3;
subplot(3,1,1)
plot(F1,X1,'-x'),title('N =
64'),axis([0 1 0 20])
subplot(3,1,2)
plot(F2, X2, '-x'), title('N =
128'),axis([0 1 0 20])
subplot(3,1,3)
plot(F3,X3,'-x'),title('N =
256'),axis([0 1 0 20])
```

- Transforms all have the same shape
- Difference is the <sup>20</sup> number of samples <sup>15</sup> used to <sup>10</sup> approximate the <sup>5</sup> shape <sup>0</sup>
- Notice the 15

   sinusoid frequency 10
   is not always well 5
   represented 0
   Depends on frequency 20
  - resolution

#### Ex: FFT Effect of Number of Samples

• Select a large value of N and vary the number of samples of the signal

```
n = [0:29];
x1 = cos(2*pi*n/10); % 3 periods
x2 = [x1 x1]; % 6 periods
x3 = [x1 x1 x1]; % 9 periods
N = 2048;
X1 = abs(fft(x1,N));
X2 = abs(fft(x2,N));
X3 = abs(fft(x3,N));
F = [0:N-1]/N;
subplot(3,1,1)
plot(F,X1),title('3
periods'),axis([0 1 0 50])
subplot(3,1,2)
plot(F,X2),title('6
periods'),axis([0 1 0 50])
subplot(3,1,3)
plot(F,X3),title('9
periods'),axis([0 1 0 50])
```

- Transforms all have the same shape
  - Looks like sinc functions
- More samples makes the sinc look more impulse-like
- FFT with large N but fewer samples does zero-padding
  - E.g. taking length N signal and windowing with box
  - Multiplication in time is convolution in frequency

#### Spectrum Analysis with FFT and Matlab

- FFT does not directly give spectrum
  - Dependent on the number of signal samples
  - Dependent on the number of points in the FFT
- FFT contains info between
   [0, *f<sub>s</sub>*]
  - Spectrum must be below  $f_s/2$
- Symmetric across f = 0 axis
  - $\Box \left[-\frac{f_s}{2},\frac{f_s}{2}\right]$
  - Use fftshift.m in Matlab

frequency / f s
