Computer Science 302 Fall 2007 Practice Final Examination

Name:_____________________________________________________

This practice examination is much longer than the real final examination will be. If you can work all the problems here, you will probably be well-prepared for the final examination.

This practice examination is 500 points.

1. True or False. [5 points each]

   (a) _____ The time to heapsort an array of $n$ items is $\Theta(n \log n)$.

   (b) _____ Open hashing uses open addressing.

   (c) _____ In the decision tree model of computation, the time complexity of any algorithm to sort $n$ items is $\Omega(n \log n)$.

   (d) _____ The height of a binary tree with $n$ nodes is $\Omega(\log n)$.

   (e) _____ A binary search tree is commonly used to represent unfulfilled obligations.

   (f) _____ Quicksort takes $O(n \log n)$ time to sort an array of $n$ items.

   (g) _____ Given the choice between two algorithms, one of which takes $O(n)$ time and the other of which takes $O(n^2)$ time, it is always best to choose the one which takes $O(n)$ time.

   (h) _____ The built-in function random is an excellent choice for a hash function.

2. [5 points] What are the smallest and largest possible number of nodes that a 2-3 tree with height 3 could have? _______ and _______.

3. [10 points] What implementation of the ADT search structure would you use if the expected number of items in the structure is 1?
4. [10 points each] For each of the following code fragments, express the asymptotic time complexity by choosing the best of the following answers: $O(n)$, $O(n^2)$, $O(n \log n)$, $O(\log n)$, $O(\log \log n)$, $\Theta(n)$, $\Theta(n^2)$, $\Theta(n \log n)$, $\Theta(\log n)$, $\Theta(\log \log n)$

(a) for (int i = 0; i < n; i++)
   cout << "Hi there.";

(b) for (int i = 0; i < n; i = 2*i+1)
   cout << "Hi there.";

(c) for (int i = 0; i < n; i++)
    for (int j = i; j > 0; j = j/2);
    cout << "Hi there.";

(d) for (int i = 0; i < n; i++)
    for (int j = n; j > i/2; j = j/2);
    cout << "Hi there.";

(e) for (int i = 0; i < n; i = i*i+1)
    cout << "Hi there.";

(f) for (int i = 0; i < n; i++)
    { int j = unknown(i);
      // unknown is a function whose value could be anything; we have no clue!
      if (i < j)
        i = j;
    cout << "Hi there.";
    }

5. [30 points]

(a) Describe the meaning of the word collision as used in discussions of hashing.

(b) How are collisions handled in closed hashing?

(c) How are collisions handled in open hashing?
6. [10 points] What implementation of the ADT search structure would you use if $n$ items are to be inserted at once at the beginning of the program, there will be no further inserts, and find will be executed $n^2$ times during the running of the program? (There is more than one correct answer to this problem, as well as several inferior answers.)

7. [20 points] Walk through the steps of the stack algorithm used to evaluate the following postfix expression, showing the stack at each step: (Hint: there will be approximately 9 illustrations of the stack.)

$$5 \ 6 \ + \ 3 \ * \ 2 \ 3 \ * \ -$$
8. [20 points] Find an optimal prefix code for the alphabet \( \{A, B, C, D, E, F, G, H\} \), if the frequencies of the symbols are as given in the following table:

\[
\begin{array}{ll}
A & 35 \\
B & 7 \\
C & 32 \\
D & 5 \\
E & 16 \\
F & 4 \\
G & 11 \\
H & 5 \\
\end{array}
\]

9. [30 points]

The *Partition* step of Quicksort has a loop invariant. Give that loop invariant, and illustrate its meaning by drawing a figure, or figures.
10. [30 points] Explain the difference between dynamic programming and memoization.

11. [30 points] Describe each of the following types of search. (Be sure to say what the structure is that is being searched in each case.)
   
   (a) Linear search.
   
   (b) Binary search.

12. [20 points] Draw “before” and “after” figures illustrating left rotation.
13. [10 points] Suppose an $5 \times 6 \times 8$ array $A$ is stored in column-major order, with base address 1000, and one word is required for each entry. What is the address of $A[3,2,6]$? Assume that array indices start at 0, as in C++.

14. [20 points] Write pseudocode for the array implementation of the ADT “stack of integer.” Your code should include procedures that implement `$\text{pop}$`, `$\text{push}$`, and `$\text{empty}$`.

15. [20 points] Explain how you would insert and delete from a queue, given that you are using singly linked nodes in a circular linked list implementation. Draw pictures.
16. [25 points] Explain how insertion works in a 2,3-tree. Hint: the phrase “node splitting” or the equivalent must be in your explanation.

17. [30 points] Given the following:

```cpp
class BST { // Binary Search Tree
    public:
        BST(int); // initializes item field to parameter, links to 0
        void static inorderWrite(BST*); // all items to standard ostream inorder
        void static insert(int, BST*&) { // inserts parameter, if not there
            bool find(int, BST*); // parameter is in the binary search tree
    
    private:
        int item; // the value stored in the node
        BST * left; // pointer to the left subtree
        BST * right; // pointer to the right subtree
};
```

Complete the following code by writing exactly three lines:

```cpp
void BST::inorderWrite(BST * t){
    if (t != 0){
        // Your three lines go here.
    }
}
```
18. [30 points] If you use Heapsort to sort an array, the first step is to heapify the array. Given the following array, show the steps of that heapification, assuming that your final array will be sorted in alphabetical order from left to right. The number of rows in the table below may or may not be the correct number of steps; you might not use all the rows, or you might have to add more rows.

\[
\begin{array}{cccccccc}
A & L & G & O & R & I & T & H & M \\
\hline
\hline
\hline
\hline
\hline
\hline
\end{array}
\]

\[
\begin{array}{cccccccc}
A & L & G & O & R & I & T & H & M \\
\hline
\hline
\hline
\hline
\hline
\hline
\end{array}
\]
19. [30 points] Suppose you are writing a dynamic programming algorithm to find the minimum weight path between a given source vertex $S$ and a given target vertex $T$ in a weighted directed acyclic graph $G$.

(a) Describe the subproblems.

(b) In what order would you work the subproblems?

20. [30 points] Use tropical (min-plus) matrix multiplication to solve the all-pairs minimum weight path problem for the weighted directed graph shown in Figure 1.

![Figure 1: A weighted directed graph for problem 20](image-url)
